

Attach flowers to a wedding arch by securing a floral cage or bundle of sturdy greenery to the frame, then wiring the flower stems into that base. Use multiple attachment points, keep the heaviest arrangements close to the frame, and check that nothing shifts before the ceremony.

Start with a stable frame

Set up the arch where it will stand before adding flowers. Check that its legs are firmly planted and that the structure does not rock when you gently push it. Flowers add weight, especially when their water source is included, so a frame that feels unsteady while bare needs attention first.

For an outdoor ceremony, follow the frame maker's instructions for anchoring it. Wind can catch both the arch and its greenery. Avoid relying on flowers or their ties to hold the structure in place.

Plan the arrangement around the strongest parts of the frame. Placing a large cluster near a joint or upright helps keep its weight supported, rather than pulling on the middle of a long, thin bar.

Build a secure base

A floral cage gives stems a compact structure that can be fastened to an arch. Choose one designed for fresh flowers and secure it tightly to the frame with floral wire or cable ties. Use at least two attachment points so the cage cannot easily twist.

Another option is to wire a bundle of sturdy greenery directly to the arch and use it as a base for smaller flower stems. Bind the greenery in several places, then tug gently to make sure it stays put. Cover the fastenings with leaves as you work, but leave enough access to tighten them if needed.

- Floral wire is useful for binding stems and wrapping around narrow sections of the frame.
- Cable ties can hold a cage or a heavier bundle firmly against the structure.
- Water tubes can supply individual stems that cannot reach a wet floral cage.

Add flowers in layers

Place larger flowers first, close to the base, so their weight does not pull long stems outward. Insert stems firmly into the cage, or wire them to the greenery base. Support a heavy flower near its stem rather than tying around its petals.

Add smaller blooms and foliage to fill gaps and soften the edges. Vary their direction for a natural shape, but keep the attachment points close to the frame. If a stem droops or slides when touched, give it its own tie rather than depending on nearby flowers to hold it.

Keep flowers fresh and check the fixings

Give fresh flowers a water source wherever practical. If using floral foam in a cage, soak it according to its instructions before inserting stems. Keep water tubes upright and securely attached so they do not slip from view onto the ground.

Finish as close to the ceremony as practical, especially in warm weather. Once the flowers are in place, gently test each cage and bundle, trim loose tie ends, and check the arrangement from both sides. Keep spare wire and ties nearby for a final adjustment.

A secure arch should look generous without feeling crowded. A few well supported clusters are easier to keep steady than flowers attached everywhere.
