Players place a stake and navigate a grid filled with concealed tiles. Behind these tiles lie either multipliers (gems, coins, or gold) or mines.

The objective is basic: reveal as numerous multipliers as possible without clicking on a mine. Each effective click increases the gamer's possible payout, while striking a mine results in the loss of the existing stake. The core appeal of the game lies in the "squander" mechanic, which enables gamers to protect their winnings anytime before proceeding to the next tile.

How the Game Mechanics Work

The game counts on a Provably Fair algorithm, guaranteeing that the placement of mines is randomized and proven. When a round begins, the server produces a grid-- generally 5x5-- and distributes an established variety of mines across it. The gamer then connects with the grid in the following sequence:

1. **Setting the Parameters:** Before the very first click, the player selects their bet quantity and the variety of mines they wish to consist of in the grid (e.g., 1 to 24 mines in a 25-tile grid).
2. **The Reveal:** The player clicks a tile. If it is a multiplier, the balance increases, and the player can choose to "Cash Out" or continue.
3. **The Risk:** If a mine is set off, the round ends quickly, and the stake is forfeited.
4. **The Multiplier Growth:** The more mines selected at the start, the higher the multiplier for each successful tile opened.

Understanding Risk vs. Reward

The table below illustrates how different mine counts impact the prospective development of a gamer's preliminary stake.
