Solar lentigines (Age spots)

Mole vs. Wart vs. Skin Tag: A Visual Guide to Common Skin Growths

Moles, warts, and skin tags are common skin growths that can look similar but have distinct causes, appearances, and health implications. This guide provides a clear side-by-side comparison to help you identify them.

MOLE (Nevus)

DEFINITION

A benign growth of pigment-producing cells (melanocytes). Caused by genetics, sun exposure, or hormonal changes.

KEY FINDING

Looks smooth, has a uniform color, and can be flat or raised. They are not contagious and hair may grow from them.

RISK FACTOR

Carries a low but possible risk of transforming into melanoma skin cancer. Monitor for ABCDE changes (Asymmetry, Border, Color, Diameter, Evolving).

WART

DEFINITION

A viral skin infection caused by HPV (human papillomavirus). It is highly contagious through direct contact.

KEY FINDING

Has a rough, grainy, "cauliflower-like" surface. Often contains small black dots, which are clotted blood vessels.

RISK FACTOR

Can spread easily to other body parts and can multiply. Requires medical treatment like cryotherapy or laser to remove.

SKIN TAG (Acrochordon)

DEFINITION

A soft, benign overgrowth of normal skin tissue. Caused by friction and is common in skin folds.

KEY FINDING

Appears soft, floppy, and hangs from the skin by a thin stalk. It is not contagious and is usually the same color as the skin.

RISK FACTOR

Has zero cancer risk and is not contagious. Removal is typically for cosmetic reasons or if it becomes irritated.

Feature	Mole	Wart	Skin Tag
Cause	Pigment cell growth	HPV virus infection	Friction & metabolic factors
Contagious	No	Yes	No
Surface	Smooth or raised	Rough & grainy	Soft & hanging
Cancer Risk	Low but possible	None	None
